

Poly-Lined Pipe

Water quality issues are no issue.

Zimmatic Poly-Lined Pipe developed with the “Best In Class” industrial process is the leading solution for growers who irrigate in corrosive water environments.

FEATURES

- + **Recessed Poly Flange:**
Ensures direct steel-to-steel contact for steel-on-steel joints to prevent poly compression
- + **Improved Span Pipe Joint:** Eliminates flange gaps, enhancing structural integrity
- + **Proprietary Reversion Process:** Minimizes lateral movement caused by temperature fluctuations, reducing stress on poly flanges and outlets while preventing water leakage behind the liner
- + **Extended Lifespan:**
Less stress and corrosion means fewer leaks and longer service life

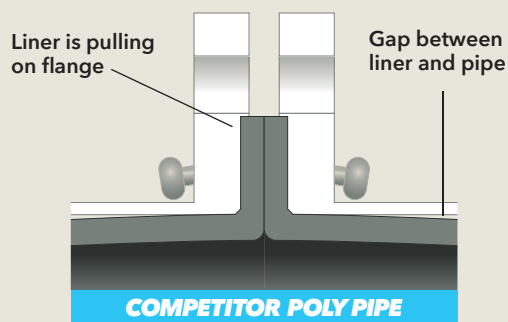

ZIMMATIC™

Engineered to perform in the toughest conditions.

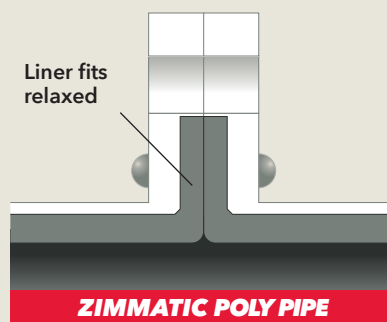

Zimmatic's polyethylene-lined "poly pipe" is purpose-built for center pivot irrigation systems operating in corrosive water environments. Whether the water source contains oxygen, hydrogen sulfide, low pH, low alkalinity, or even crop chemicals and wastewater, these conditions can accelerate pipe degradation.

Zimmatic poly pipe is designed to resist these challenges—keeping water flowing reliably even in extreme conditions. Developed with direct input from growers, this innovative solution delivers durability, efficiency, and peace of mind when it matters most.

Competitor's Manufacturing Process

The competitors stretch the liner during installation, which relaxes over time and creates gaps. These gaps allow water intrusion, leading to corrosion and early failure.

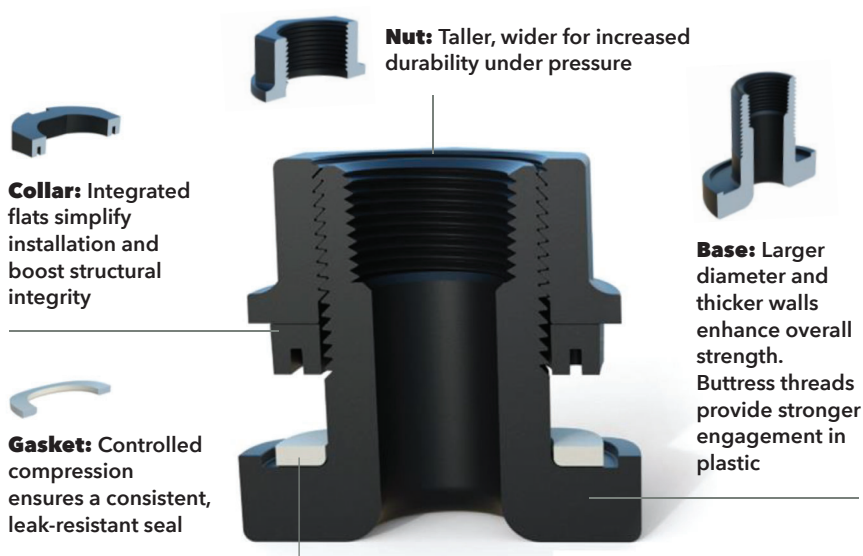

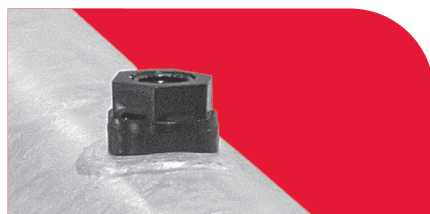

Zimmatic Manufacturing Process

A proprietary press-fit process locks the liner into place without residual tension. This prevents shifting and ensures sprinkler coupler cutouts stay aligned—eliminating leaks caused by misalignment.

Stronger Outlets by Design

Every outlet includes a welded washer for precise coupler alignment and a stable torque surface. The outlet geometry supports a tougher gasket and a specifically designed collar for a secure, leak-resistant fit.
